

5JS BOOKKEEPING

COR Registry & Compliance Tracker

A system walkthrough for the owner — how it works, every tab and function, what's changed recently, and what's still ahead.

AGENDA

What we'll cover

01 Why this system exists

02 Daily Workflow — Calendar, Tasks, Client Registry, Scanner

03 Tax & Filing Data — Sales Summary, PT, 2307, SAWT, Report

04 Security & Accountability

05 What's new, and what's next

WHY THIS SYSTEM

One shared, live system instead of scattered files

Before

- Per-year Excel workbooks, one per client type
- No single source of truth for Client ID, TIN, or Tax Type
- Changes untracked — no record of who edited what
- Credentials kept in plain text, shared ad hoc

Now

- One live database, ten connected tabs, shared by all staff
- Client Registry as the single source of truth
- Every edit logged: field, old value, new value, who, when
- Credentials encrypted at rest, reveals logged

SYSTEM MAP

Ten tabs, one database

Filing Calendar
Deadlines & alerts

Task Tracker
Per-client to-dos

Client Registry
Master client list

Scan & Add
OCR from COR photo

Credentials
Encrypted accounts

Sales Summary
Quarterly figures, PT

2307 Register
Certificates issued

SAWT / Received
Certificates received

eBIRForms Profile
Copy-ready client fields

Settings
Cleanup & audit tools

SECTION ONE

Daily Workflow

Filing Calendar, Task Tracker, Client Registry, Branch ID Numbering, and the Scanner — where staff spend most of their day.

Nothing gets missed

BIR deadlines, tracked

Filing and payment due dates for every client, surfaced before they're due instead of being chased after the fact.

"Needs attention" tiles

Live tiles that jump straight into Sales Summary or SAWT with the right filter already applied — no manual searching for who's behind.

A to-do list per client, shared live

Edit in place

Every cell is directly editable — saved to the live database the moment it changes.

Status filters

Including "0 FILING" and "FOR CLOSURE" — so a zero-filer or an exiting client is never confused with an active one.

Live sync

Two staff on the same tab see each other's edits in real time — no stale, conflicting copies.

The single source of truth

Every other tab reads its Name, TIN, and Trade Name from here. Full COR details per client, plus the fields every other feature depends on:

Field	What it drives
Tax Type (VAT / Non-VAT / Branch / Non-Profit)	Which tax rules apply, incl. Percentage Tax automation
Registering Office + Main Client ID	Branch Client ID Numbering
Client Status (incl. 0 FILING, FOR CLOSURE)	Filters across Tracker, Sales Summary, Report
Business Size (RA 11976 / EOPT)	Audit exposure & invoicing rules

Branch Client ID Numbering

Head Office
5JS-0001

5JS-0001-B1 — Branch

5JS-0001-B2 — Branch

Set a Branch client's **Registering Office** and **Main Client ID** in the Client Registry — this tool then auto-assigns a clean suffixed ID off its Main in one click.

Idempotent, and a rename cascades automatically to that branch's existing Sales Summary rows and 2307 entries so nothing gets orphaned.

Onboard a new client in minutes

</> 1. Upload Snap or upload a photo of the client's COR.	Q 2. Auto-extract OCR reads Name, TIN, RDO, Tax Type, registered forms.	✓ 3. Review & save Staff confirms the fields, then it's added straight to the Client Registry.
---	---	--

SECTION TWO

Tax & Filing Data

Sales Summary, Percentage Tax automation, the 2307 Register, SAWT, and eBIRForms Profile — where the actual filings get built.

Quarterly figures, per client, per year

Auto-totaled

Total Sales, Expenses, and Net Income derive from the 4 quarters — never typed in directly, never drift out of sync.

Editable right here

Tax Type, Tax Option, and Client Status are each independently editable per row — no trip back to the Registry needed.

Linked to the Registry

Every row created here is auto-filled from — and stays linked to — its Client Registry entry.

Percentage Tax Due computes itself

Checks both Tax Type and this year's Tax Option — so a plain Non-VAT client who elects 8% doesn't need their registered Tax Type changed at all.

Tax Type	Tax Option	Percentage Tax Due
Non-VAT (8% Flat Rate)	—	₱0, always
Non-VAT	8% / Mixed Income – 8%	₱0, always
Non-VAT	Itemized / OSD / BMBE / Branch / Mixed Income – Itemized or OSD / blank	3% of that quarter's Sales
VAT / Branch / Non-Profit	—	Not auto-computed — stays manual

Certificates of creditable tax withheld

Print-ready BIR 2307

Entries by payor, payee, and quarter generate a formatted certificate on demand.

Recent fix: accurate "For the Period"

An entry's printed period now reflects only the months actually filled in on *that* entry — not the whole payor/payee/quarter group it belongs to.

The other side of the certificate

Where 2307s a client *received* from their own customers get logged — feeding the Summary Alphalist of Withholding Taxes (SAWT) at filing time, with the same live filters and realtime sync as every other tab.

Exactly the fields eBIRForms asks for

A narrowed, read-only view — TIN, RDO Code, Line of Business, Registered Name, Address, Zip — ready to copy straight into eBIRForms when creating or updating a client's profile there. Filterable by client status, tax type, and registered forms.

SECTION THREE

Security & Accountability

Credentials, audit history, access tiers, and realtime sync — how the system protects client data and keeps everyone accountable.

BIR & SEC accounts, encrypted

Encrypted at rest

Stored passwords for BIR Portal and SEC OST accounts are never saved or shown in plain text.

Every reveal logged

Clicking "Show" on a password writes who viewed it and when — visible, never editable, from within the app.

Every field edit, on record

Task Tracker, Sales Summary, SAWT, and Client Registry each log field-level changes automatically.

FIELD	OLD → NEW	CHANGED BY
Tax Option	Itemized → 8%	staff@5js.com

Admin and Staff see different things

Admin

- Full read/write across every tab
- Can delete records
- Manages Settings-tab cleanup tools

Staff

- Full read/write on day-to-day work
- No delete access
- Same live data, same realtime sync

CROSS-CUTTING · REALTIME SYNC

No one works from a stale copy

Task Tracker, Sales Summary, 2307 Register, SAWT, and Client Registry all sync live — across every open session.

A toolbox for keeping data clean

Clean Up Tax Type / Tax Option Names

Bulk-retitle stray free-typed values onto the canonical list, in one click.

Branch Client ID Numbering

Assigns clean Main-ID-based suffixes to every unnumbered branch.

Relink Unlinked Sales Summary Rows

Finds rows with a blank or broken Client ID and relinks them by Name, with TIN as a tiebreaker for Head Office vs. Branch.

Branch Tag vs. Client Registry Audit

Flags any Sales Summary row tagged Branch that isn't consistently set up in the Registry.

SECTION FOUR

What's shipped recently

- ✓ **2307 Register:** a certificate's printed period now reflects only that entry's own filled-in months, not its whole payor/payee/quarter group.
 - ✓ **Tax Option expanded:** from 8% / Itemized / OSD to also cover BMBE, Branch, and Mixed Income Earner (split into its own 8% / Itemized / OSD elections) — with a matching filter and cleanup tool.
 - ✓ **Relink tool + TIN tiebreaker:** fixes rows with a blank or mismatched Client ID, now resolving Head Office vs. Branch pairs that share the same Name.
 - ✓ **Branch Tag Audit:** a new Settings tool that flags Sales Summary rows tagged Branch whose Client Registry setup doesn't actually match.
-

WHAT'S NEXT

Still on the list

PENDING

Run the 2 pending SQL migrations (branch Client ID + Sales Summary Client Status) against the live database

PENDING

Set up a Resend account and send a test email for the twice-weekly "needs attention" digest

ONGOING

Keep refining based on real data as it surfaces — the Relink and Branch Audit tools both came directly from real client cases found this way

Questions?

Open the live tracker any time, or flag anything that looks off — most of what's in this deck started as exactly that.
